LABSHEET 08

TEMPLATE INHERITANCE BLUEPRINTS & MODULAR UI ENGINEERING

Develop a core master template layout blueprint file containing shared menus and block overrides; inherit properties down across specialized views (Home, About Us, Contact Us).

Task 8.1: Embed custom programmatic markers within the master view framework to dynamically assign context specific CSS structural active utility highlights to the active navigation item.

```
from django.http import HttpResponse
def home(request):
    active = "home"
    return page("Home", active)
def about(request):
    active = "about"
    return page("About Us", active)
def contact(request):
    active = "contact"
    return page("Contact Us", active)
def page(title, active):
    return HttpResponse(f"""
    <html>
    <style>
        body {{ font-family: Arial; text-align: center; }}
        nav {{ background: #222; padding: 20px; }}
        nav a {{ color: white; margin: 20px; text-decoration: none; }}
        .active {{ color: yellow !important; font-weight: bold; }}
    </style>
```

```
    <nav>
        <a class="{'active' if active == 'home' else ''}" href="/">Home</a>
        <a class="{'active' if active == 'about' else ''}" href="/about/">About Us</a>
        <a class="{'active' if active == 'contact' else ''}" href="/contact/">Contact Us</a>
    </nav>
    <h1>{title}</h1>
    <p>Welcome to the {title} page.</p>
    </html>
    """)
# urls.py:
# path("", views.home)
# path("about/", views.about)
# path("contact/", views.contact)
```

Task 8.2: Integrate a persistent user message feedback notification box using inherited template placeholder hooks across all child application page screens.

```
from django.http import HttpResponse
def page(title):
    return HttpResponse(f"""
    <html>
    <style>
        body {{ font-family: Arial; text-align: center; }}
        nav {{ background: #222; padding: 15px; }}
        nav a {{ color: white; margin: 15px; }}
        .message {{ background: #dff0ff; padding: 15px; margin: 20px; }}
    </style>
    <nav>
        <a href="/">Home</a>
        <a href="/about/">About Us</a>
        <a href="/contact/">Contact Us</a>
```

```
    </nav>
    <!-- Persistent Feedback Notification -->
    <div class="message">
        <b>Feedback:</b> Thank you for visiting our website!
    </div>
    <h1>{title}</h1>
    <p>Welcome to the {title} page.</p>
    </html>
    """)
def home(request):
    return page("Home")
def about(request):
    return page("About Us")
def contact(request):
    return page("Contact Us")
# urls.py:
# path("", views.home)
# path("about/", views.about)
# path("contact/", views.contact)
```

Task 8.3: Build a professional Contact Us form view page that forwards verified feedback text parameters directly into the server logs for system verification.

```
from django.http import HttpResponse
import logging
logger = logging.getLogger(__name__)
def contact(request):
    if request.method == "POST":
        name = request.POST.get("name", "").strip()
        feedback = request.POST.get("feedback", "").strip()
        if name and feedback:
            logger.info("Verified Feedback - %s: %s", name, feedback)
```

```
            message = "Feedback submitted successfully!"
        else:
            message = "Please enter all details."
    else:
        message = ""
    return HttpResponse(f"""
    <html>
    <style>
        body {{ font-family: Arial; text-align: center; }}
        form {{ margin: 30px auto; width: 350px; }}
        input, textarea {{ width: 100%; padding: 10px; margin: 8px; }}
        button {{ padding: 10px 25px; }}
        .msg {{ color: green; }}
    </style>
    <h1>Contact Us</h1>
    <form method="POST">
        <input type="text" name="name" placeholder="Your Name" required>
        <textarea name="feedback" placeholder="Your Feedback" required></textarea>
        <button type="submit">Submit</button>
    </form>
    <p class="msg">{message}</p>
    </html>
    """)
# urls.py:
# path("contact/", views.contact)
```
